

Assignment - 1

Checking the top 5 CWE vulnerabilities(2021)

1. Broken Access Control -

CWE : CWE - 862: Missing Authorization

OSWAP CATEGORY: A01:2021- Broken Access Control

Description -

The product does not perform an authorization check when an actor attempts to access a resource or perform an action.

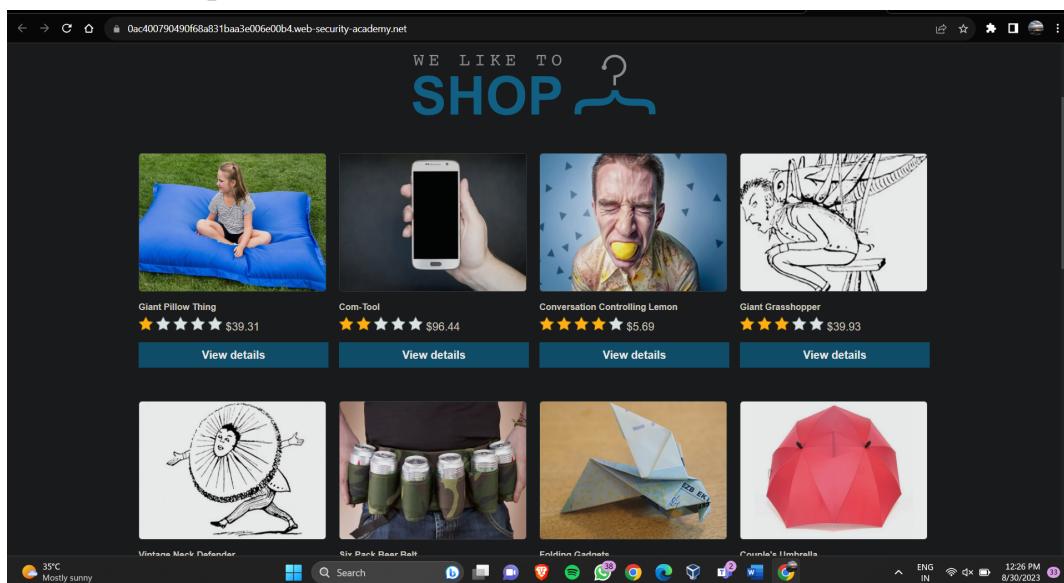

Business Impact -

Assuming a user with a given identity, authorization is the process of determining whether that user can access a given resource, based on the user's privileges and any permissions or other access-control specifications that apply to the resource.

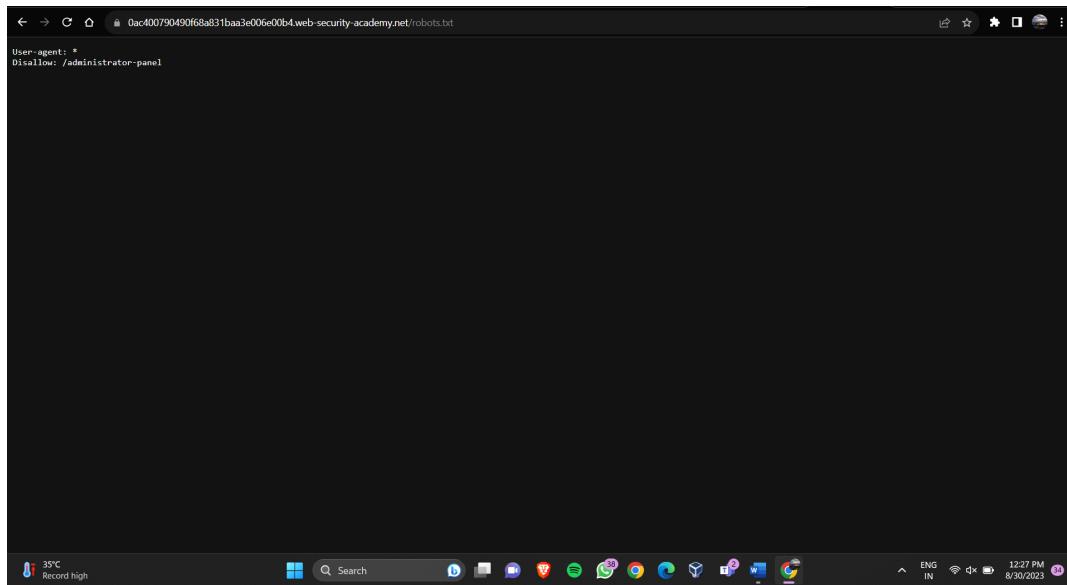

When access control checks are not applied, users are able to access data or perform actions that they should not be allowed to perform. This can lead to a wide range of problems, including information exposures, denial of service, and arbitrary code execution.

Practical implementation -

Visit an example website.

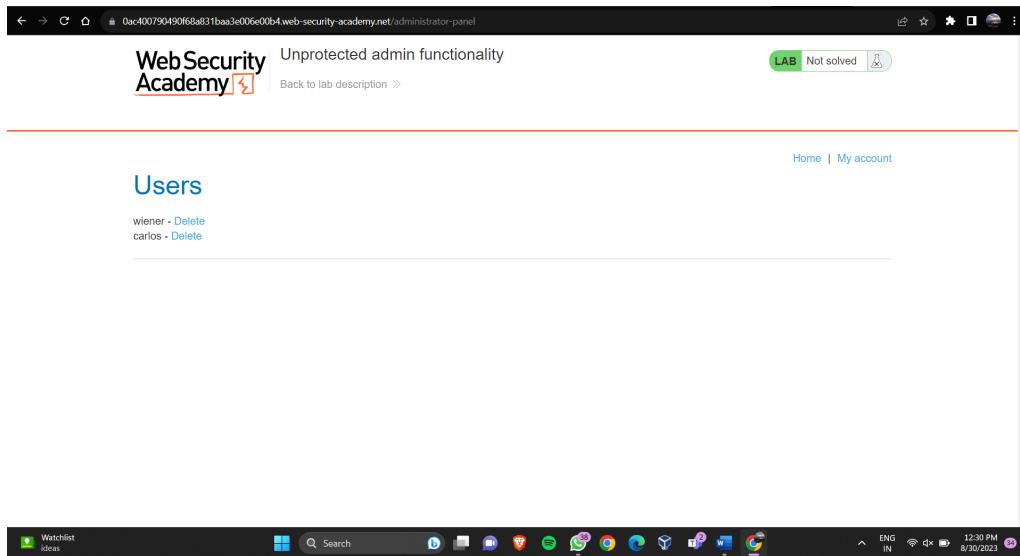

Write robot.txt in the URL.

The above given site has vulnerability of broken access control because the Admin panel can be used using .txt in the URL

We can access admin panel.

Therefore the above image shows that website has broken access control vulnerability.

2. Cryptographic Failures -

CWE: CWE - 324 :Use of a key past its expiration date

OSWAP CATEGORY: A02:2021- Cryptographic Failures

Description -

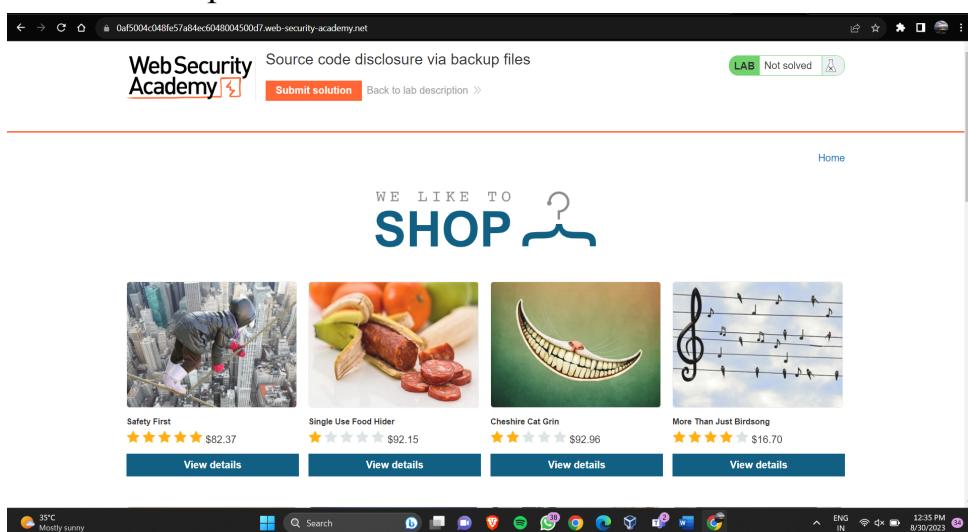

The product uses a cryptographic key or password past its expiration date, which diminishes its safety significantly by increasing the timing window for cracking attacks against that key.

Business Impact -

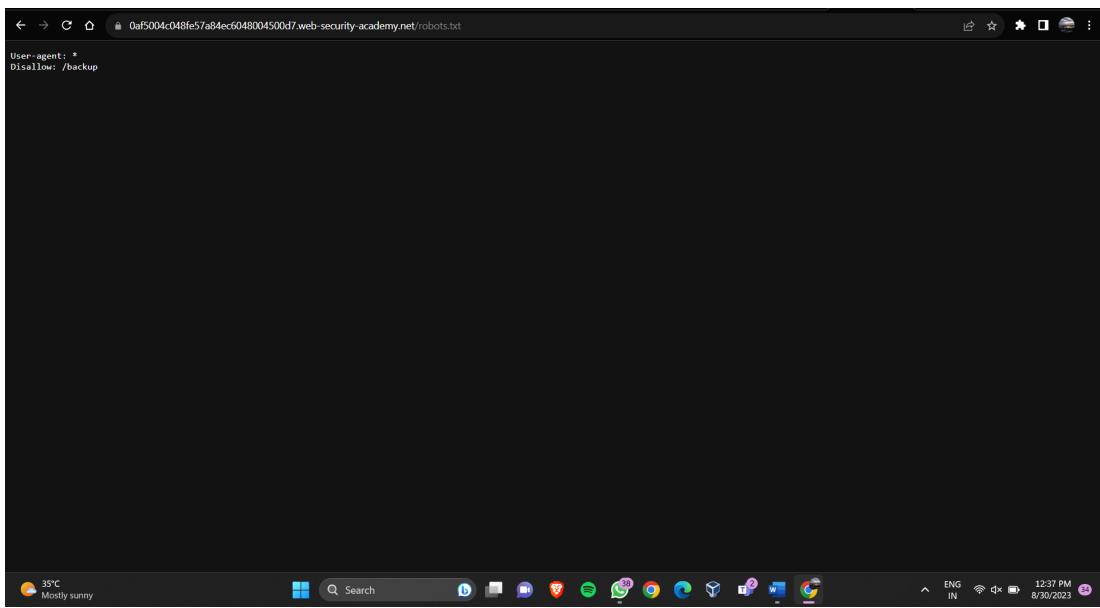

While the expiration of keys does not necessarily ensure that they are compromised, it is a significant concern that keys which remain in use for prolonged periods of time have a decreasing probability of integrity. For this reason, it is important to replace keys within a period of time proportional to their strength.

Practical Implementation -

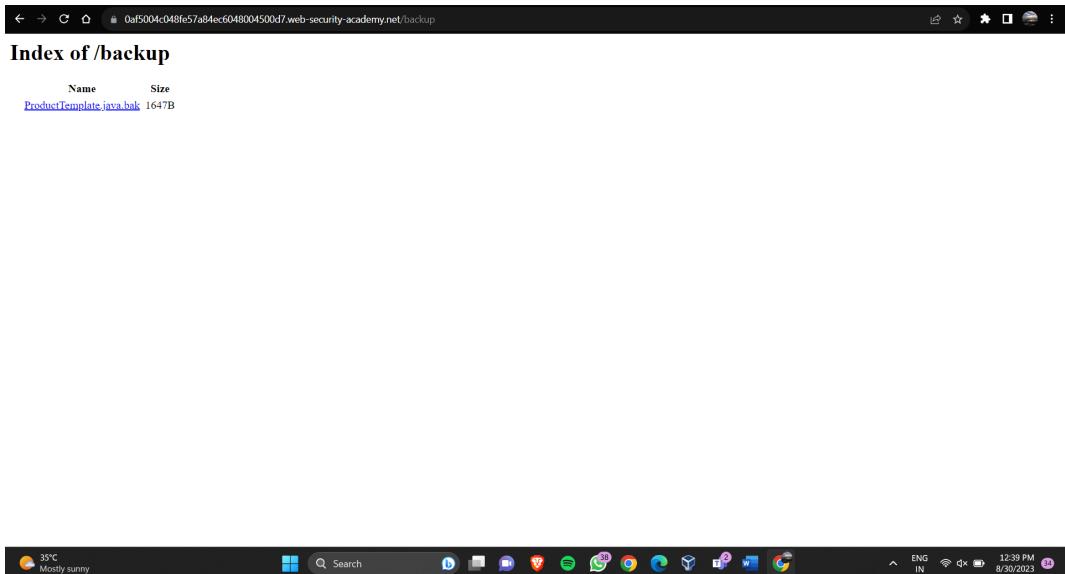

Visit an example website.

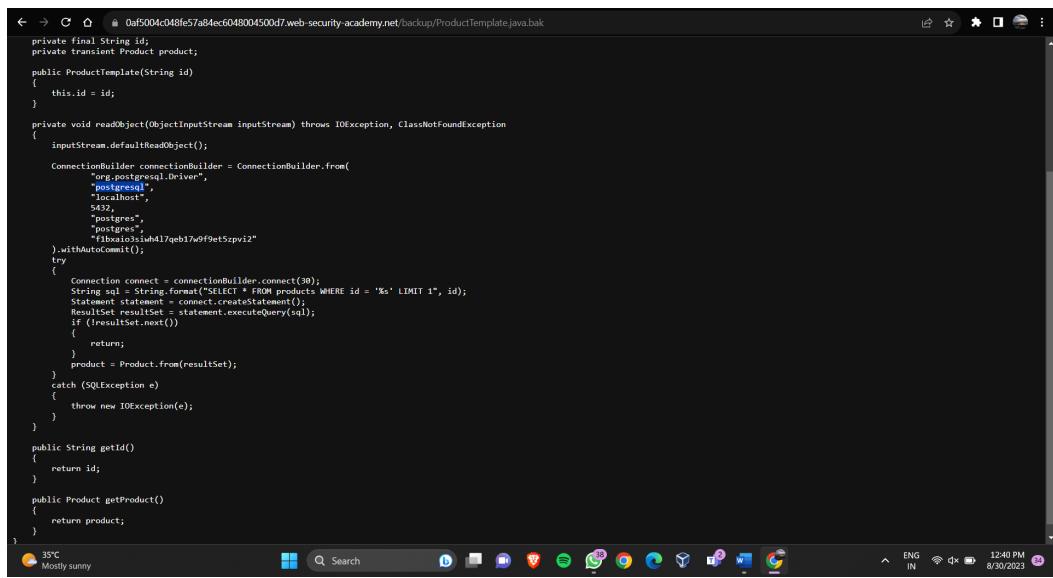

Upon adding /robots.txt to the URL of the website , we get the disallowed link.

Adding the disallowed link to URL of the website.

Use the file , open it to get the decrypted password for the backup storage of the website.

```

private final String id;
private transient Product product;

public ProductTemplate(String id)
{
    this.id = id;
}

private void readObject(ObjectInputStream inputStream) throws IOException, ClassNotFoundException
{
    inputStream.defaultReadObject();

    ConnectionBuilder connectionBuilder = ConnectionBuilder.from(
        "org.postgresql.Driver",
        "postgresql",
        "localhost",
        5432,
        "postgres",
        "postgres",
        "fbxxia33iwid17qeb17wf9et5zpviz"
    ).withAutoCommit();
    try
    {
        Connection connect = connectionBuilder.connect(30);
        String sql = String.format("SELECT * FROM products WHERE id = '%s' LIMIT 1", id);
        Statement statement = connect.createStatement();
        ResultSet resultSet = statement.executeQuery(sql);
        if (!resultSet.next())
        {
            return;
        }
        product = Product.from(resultSet);
    } catch (SQLException e)
    {
        throw new IOException(e);
    }
}

public String getId()
{
    return id;
}

public Product getProduct()
{
    return product;
}

```

Therefore , website has vulnerability in cryptographic failures as the password was not encrypted before storing.

3. Injection -

CWE-94: Improper Control of Generation of Code ('Code Injection')

OSWAP CATEGORY: A03:2021- Injection

Description -

The product constructs all or part of a code segment using externally-influenced input from an upstream component, but it does not neutralize or incorrectly neutralizes special elements that could modify the syntax or behavior of the intended code segment.

Business Impact -

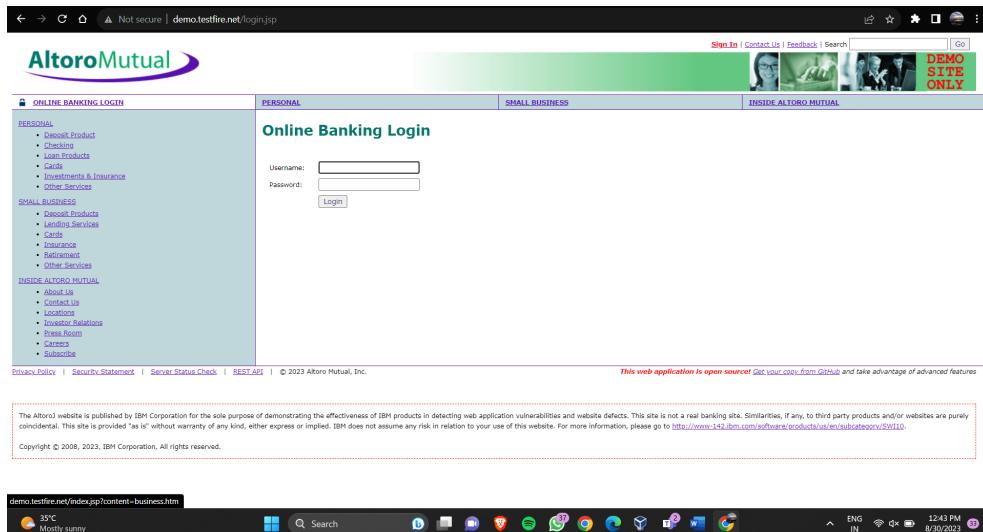

When a product allows a user's input to contain code syntax, it might be possible for an attacker to craft the code in such a way that it will alter the intended control flow of the product. Such an alteration could lead to arbitrary code execution.

Injection problems encompass a wide variety of issues -- all mitigated in very different ways. For this reason, the most effective way to discuss these weaknesses is to note the distinct features which classify them as injection

weaknesses. The most important issue to note is that all injection problems share one thing in common -- i.e., they allow for the injection of control plane data into the user-controlled data plane. This means that the execution of the process may be altered by sending code in through legitimate data channels, using no other mechanism. While buffer overflows, and many other flaws, involve the use of some further issue to gain execution, injection problems need only for the data to be parsed. The most classic instantiations of this category of weakness are SQL injection and format string vulnerabilities.

Practical Implementation -

Visit any sample website

The screenshot shows a web browser window with the URL demo.testfire.net/login.jsp. The page is titled "Altoro Mutual". The header includes links for "Sign In", "Contact Us", "Feedback", and "Search". The main content area is titled "Online Banking Login" and contains fields for "Username" and "Password". On the left sidebar, there are sections for "PERSONAL" (Deposit Product, Checking, Loan Products, Cards, Investments & Insurance, Other Services) and "SMALL BUSINESS" (Deposit Products, Lending Services, Cards, Insurance, Retirement, Other Services). A note at the bottom right says "This web application is open source" with a link to GitHub. The footer includes links for "Privacy Policy", "Security Statement", "Server Status Check", and "REST API".

Try admin and any random password.

Rohit Patiballa

21BCI0278

The screenshot shows a web browser window for 'demo.testfire.net/login.jsp'. The header bar includes links for 'Sign Off', 'Contact Us', 'Feedback', and a search bar. A green banner at the top right says 'DEMO SITE ONLY'. The main content area is titled 'Online Banking Login' and displays a red error message: 'Login Failed: We're sorry, but this username or password was not found in our system. Please try again.' Below this, there are input fields for 'Username' (admin) and 'Password' (*****), and a 'Login' button. On the left sidebar, under 'PERSONAL', there are links for Deposit Product, Checking, Savings, Credit Cards, Investments & Insurance, and Other Services. Under 'SMALL BUSINESS', there are links for Deposit Products, Lending Services, Credit, Insurance, Referrals, and Other Services. At the bottom, there are links for Privacy Policy, Security Statement, Server Status Check, REST API, and a copyright notice from 2023 Altoro Mutual, Inc.

We get , wrong password message.

Now try admin'-- and password as same as your first one.

The screenshot shows a web browser window for 'demo.testfire.net/bank/main.jsp'. The header bar includes links for 'Sign Off', 'Contact Us', 'Feedback', and a search bar. A green banner at the top right says 'DEMO SITE ONLY'. The main content area is titled 'Hello Admin User' and displays a welcome message: 'Welcome to Altoro Mutual Online.' Below this, there is a dropdown menu for 'View Account Details' set to '800000 Corporate' with a 'GO' button. A 'Congratulations!' message states: 'You have been pre-approved for an Altoro Gold Visa with a credit limit of \$10000! Click [Here](#) to apply.' On the left sidebar, under 'I WANT TO ...', there are links for View Account Summary, View Recent Transactions, View My Profile, Search News Articles, and Customize Site Language. Under 'ADMINISTRATION', there is a link for Edit Users. At the bottom, there are links for Privacy Policy, Security Statement, Server Status Check, REST API, and a copyright notice from 2023 Altoro Mutual, Inc.

As you can see , login is successful !

4. Insecure Design -

CWE-539: Use of Persistent Cookies Containing Sensitive Information

OSWAP CATEGORY: A04:2021- Insecure Design

Description -

The web application uses persistent cookies, but the cookies contain sensitive information.

Business Impact -

Cookies are small bits of data that are sent by the web application but stored locally in the browser. This lets the application use the cookie to pass information between pages and store variable information. The web application controls what information is stored in a cookie and how it is used. Typical types of information stored in cookies are session identifiers, personalization and customization information, and in rare cases even usernames to enable automated logins. There are two different types of cookies: session cookies and persistent cookies. Session cookies just live in the browser's memory and are not stored anywhere, but persistent cookies are stored on the browser's hard drive. This can cause security and privacy issues depending on the information stored in the cookie and how it is accessed.

Practical Implementation -

Consider the above example , since there is a vulnerability and SQL injection can be executed there is an issue with the design. There for the above website has Insecure design vulnerability as well.

5. Security Misconfiguration

CWE-547: Use of Hard-coded, Security-relevant Constants

OSWAP CATEGORY: A05:2021- Security Misconfiguration

Description -

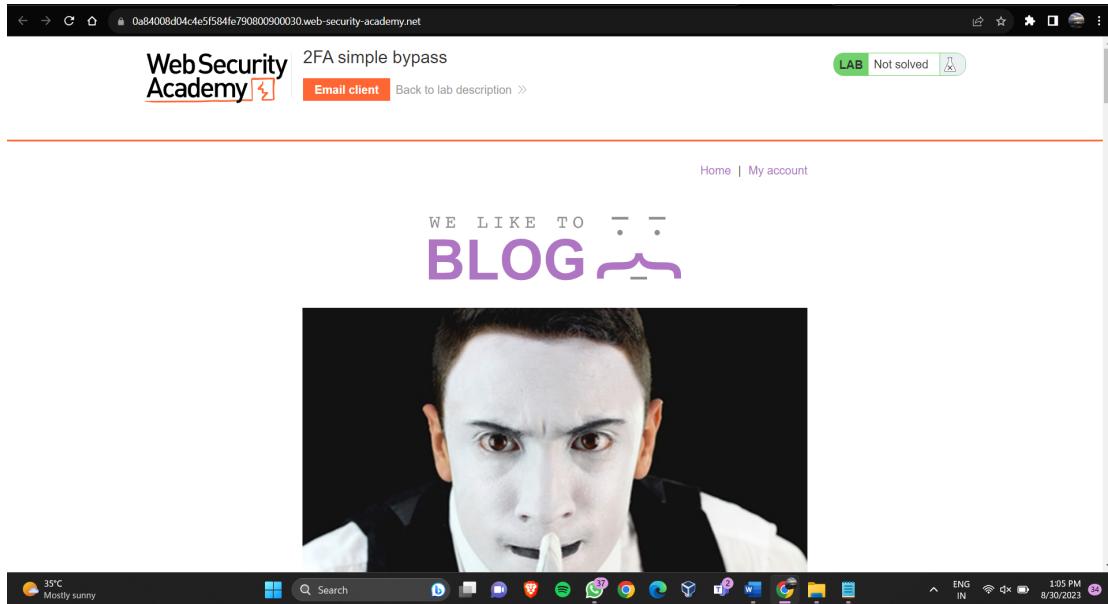

The product uses hard-coded constants instead of symbolic names for security-critical values, which increases the likelihood of mistakes during code maintenance or security policy change.

Business Impact -

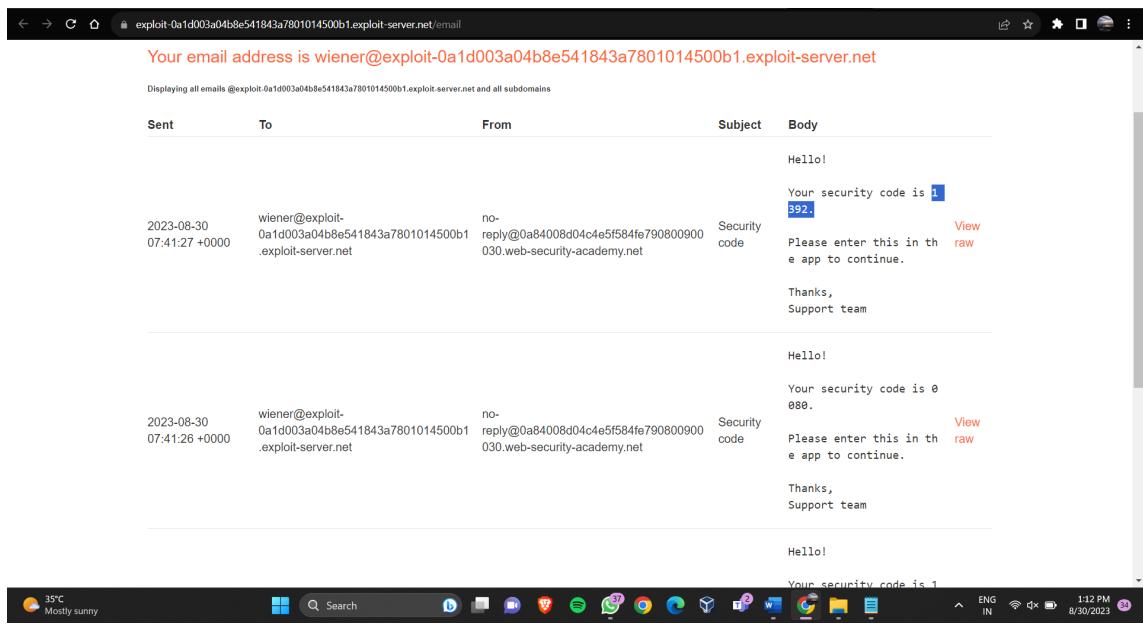

If the developer does not find all occurrences of the hard-coded constants, an incorrect policy decision may be made if one of the constants is not changed. Making changes to these values will require code changes that may be difficult or impossible once the system is released to the field. In addition, these hard-coded values may become available to attackers if the code is ever disclosed.

Practical Implementation -

Visit any sample website

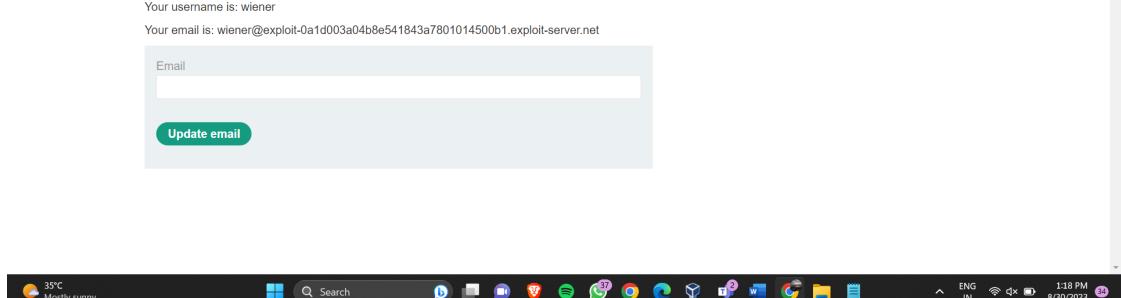

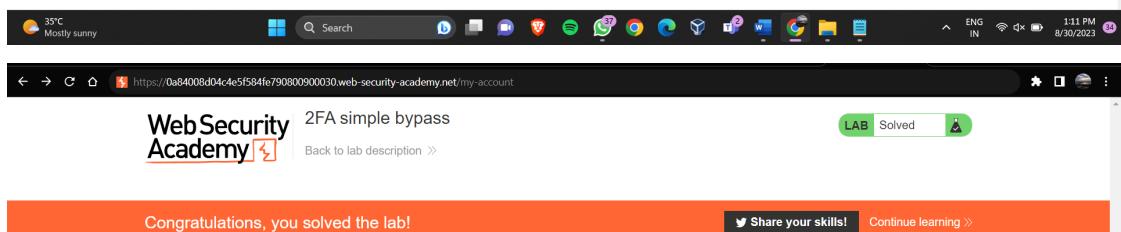

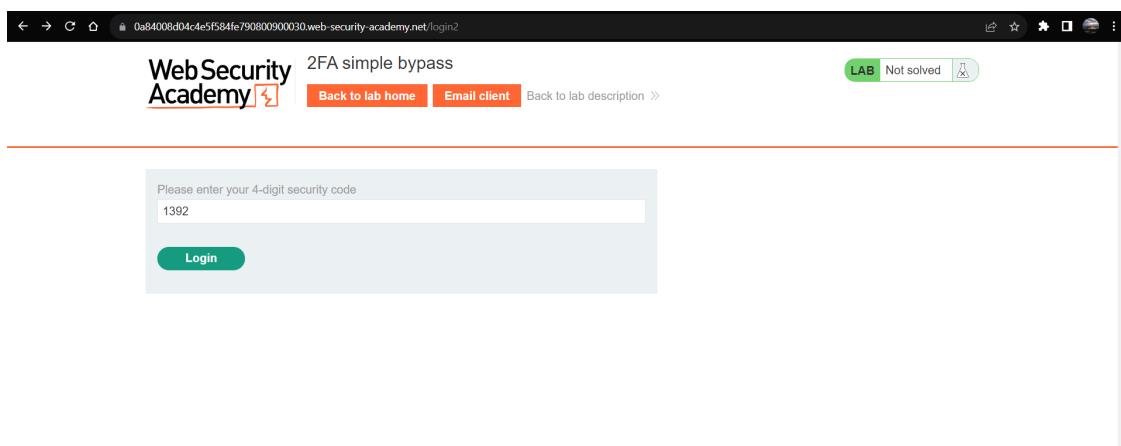

Log in with given credentials ie , username - wiener and ps - peter
You get a 2FA verification to the mail.

Rohit Patiballa

21BCI0278

Login using the 2FA code and login gets successful !

Now logout and try logging in to the victims account using given credentials ie , username - carlos and ps - montoya

Rohit Patiballa

21BCI0278

The screenshot shows a browser window with the URL <https://0a84008d04c4e5f584fe790800900030.web-security-academy.net/my-account>. The page title is "2FA simple bypass". A green button at the top right says "LAB Solved". Below it, a banner says "Congratulations, you solved the lab!". There is a form asking for a 4-digit security code with a "Login" button. The system tray at the bottom shows the date and time as 8/30/2023, 1:17 PM.

Update url to /my-account and you can access the account !

The screenshot shows a browser window with the URL <https://0a84008d04c4e5f584fe790800900030.web-security-academy.net/my-account>. The page title is "My Account". It displays the user's details: "Your username is: carlos" and "Your email is: carlos@carlos-montoya.net". Below this is a form for updating the email address, with fields for "Email" and a "Update email" button. The system tray at the bottom shows the date and time as 8/30/2023, 1:16 PM.

We logged in successfully !

Therefore the sample website has Security Misconfiguration Vulnerability.
